## Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

## **Listing of Claims**

- 1-18. (cancelled)
- 19. (currently amended) A medical device, comprising:

a proximal shaft section and a distal shaft section extending distally of the proximal shaft section;

the proximal shaft section includes a tubular proximal shaft section having a proximal end and a distal end:

a plurality of slits defined in the proximal tubular shaft section:

wherein a greater number of slits are disposed near the distal end of the proximal tubular shaft section than near the proximal end of the proximal tubular shaft section;

a distal shaft section attached to the proximal shaft section, the distal shaft section including a braid attached to the distal end of the proximal tubular shaft section;

wherein the braid overlaps the distal end of the tubular shaft such that a portion of the braid is located proximal of the distal end of the tubular shaft; and

- a polymer layer disposed over the <del>proximal and distal shaft sections</del> tubular shaft and the braid.
- (Previously presented) The medical device of claim 19, wherein the distal shaft section is deflectable.
- 21. (currently amended) The medical device of claim 19, wherein proximal shaft section the tubular shaft has a longitudinal axis and wherein the slits are arranged generally perpendicular to the longitudinal axis.
- 22. (previously presented) The medical device of claim 19, wherein the medical device has a transition in stiffness from the proximal shaft section to the distal shaft section.

23. (Cancelled)

24. (currently amended) The medical device of claim 19, wherein the number of slits per

unit length is greater near the distal end of the proximal tubular shaft section than near the

proximal end of the proximal tubular shaft section.

25. (currently amended) The medical device of claim 19, wherein the slits have a first

depth near the proximal end of the proximal tubular shaft section and a second depth near the

distal end of the proximal tubular shaft section, and wherein the second depth is deeper than the

first depth.

26. (currently amended) The medical device of claim 19, wherein the proximal tubular

shaft section is a nickel-titanium alloy tube.

27. (cancelled)

28. (currently amended) A medical device, comprising:

a proximal shaft portion having a proximal junction and a distal junction and a distal

shaft portion;

the proximal shaft portion including a tubular member having a proximal end and a distal

end, the tubular member including a plurality of slits defined in the proximal shaft portion

tubular member;

the distal shaft portion including a braid, the braid attached to the distal junction tubular

member and extending distally therefrom;

wherein the braid overlaps the distal end of the tubular member such that a portion of the

braid is located proximal of the distal end of the tubular member; and

a polymer layer disposed over the proximal shaft portion tubular member and the braid.

29. (currently amended) The medical device of claim 28, wherein the braid defines a

distal shaft portion and wherein the distal shaft portion is deflectable.

Appl. No. 10/804,360 Amdt. Dated April 25, 2008 Reply to Office Action of January 29, 2008

30. (currently amended) The medical device of claim 28, wherein the proximal shaft

portion tubular member has a longitudinal axis and wherein the slits are arranged generally

perpendicular to the longitudinal axis.

31. (currently amended) The medical device of claim 28, wherein the braid defines a

distal shaft portion, and wherein the medical device has a transition in stiffness from the

proximal shaft portion to the distal shaft portion.

32. (currently amended) The medical device of claim 28, wherein a greater number of

slits are disposed near the distal junction end of the proximal shaft portion tubular member than

near the proximal junction end of the proximal shaft portion tubular member.

33. (currently amended) The medical device of claim 28, wherein the number of slits per

unit length is greater near the distal junction end of the proximal shaft portion tubular member

than near the proximal junction end of the proximal shaft portion tubular member.

34. (currently amended) The medical device of claim 28, wherein the slits have a first

depth near the proximal junction end of the proximal shaft portion tubular member and a second

depth near the distal  $\underline{\text{junction}}$   $\underline{\text{end}}$  of the  $\underline{\text{proximal shaft portion}}$   $\underline{\text{tubular member}}$ , and wherein the

second depth is deeper than the first depth.

35. (currently amended) The medical device of claim 28, wherein the proximal shaft

portion tubular member is a nickel-titanium alloy tube.

(cancelled)

37. (currently amended) A medical device, comprising:

a slotted tubular member having a plurality of slots therein, the slotted tubular member

having a proximal end, a distal end, and a longitudinal axis;

Page 4 of 7

wherein the slots vary in number, location, frequency, size, or depth so that the tubular member varies in stiffness between the proximal end and the distal end:

a braid attached to the distal end of the tubular member and extending distally therefrom;

wherein the braid overlaps the distal end of the tubular member such that a portion of the braid is located proximal of the distal end of the tubular member; and

a polymer layer disposed over the tubular member and the braid so as to define a catheter shaft.

38. (previously presented) The medical device of claim 37, wherein the slots defined are arranged generally perpendicular to the longitudinal axis.

39-41. (cancelled)
